

PDF templates

`layouts/pdf.typ` is the Typst-side layout used by PDF and SVG notebook outputs.

```
themes/my-theme/  
layouts/  
pdf.typ
```

Before Typst runs, Calepin renders this file with MiniJinja, the same engine used for HTML layouts (see Templating), so the output is still valid Typst source. The file uses a `.typ` extension because it renders to Typst, even though it is a MiniJinja template.

Inside the layout, place notebook content with `doc.body`:

```
#set page(  
  paper: "us-letter",  
  margin: (x: 1in, y: 0.85in),  
  numbering: "1",  
)  
  
#set text(font: "Libertinus Serif", size: 10.5pt)  
  
{{ doc.body }}
```

Useful `layouts/pdf.typ` values:

- `theme`: local theme directory name
- `target`: `paged`
- `doc.path`: `.typ` input path relative to workspace
- `doc.dir`: input directory relative to workspace
- `doc.stem`: input filename without `.typ`
- `doc.title`: document title, or an empty string
- `doc.body`: notebook body, injected as a `#include`
- `doc.meta`: values from `#metadata(...)` <website-metadata>
- `vars`: merged document variables from `[vars]` in `calepin.toml`, `calepin.setup(vars: ...)`, and CLI `--var` overrides

If `doc.body` is not referenced, Calepin appends the notebook body after the rendered layout.

`theme = "typst"` disables notebook-specific theming, and `extends = "typst"` creates a local theme with no inherited Calepin base. Use an empty `layouts/pdf.typ` for a minimal pass-through layout. `notebook.typ.jinja` and `paged.typ.jinja` are not supported.
