

# Install

## Typst CLI

Calepin requires Typst 0.15.0 or newer. Install or update the Typst CLI from the Typst installation instructions, and make sure it is available on your PATH.

## Calepin

MacOS and Linux:

```
curl --proto '=https' --tlsv1.2 -LsSf https://github.com/vincentarelbundock/calepin/releases/latest/download/calepin-installer.sh | sh
```

Windows via powershell:

```
powershell -ExecutionPolicy Bypass -c "irm https://github.com/vincentarelbundock/calepin/releases/latest/download/calepin-installer.ps1 | iex"
```

## Jupyter support

Calepin has built-in support for **Python** and **R**, and can also run many other languages through Jupyter kernels, but that requires installing the language kernel and kernel client tooling.

To use a Jupyter kernel, install `jupyter_client` first:

```
pip install jupyter_client
```

Most kernels then install with a single `pip install`:

```
pip install bash_kernel      # Bash
pip install octave_kernel    # GNU Octave
pip install gnuplot_kernel    # Gnuplot
```

Some Python kernel packages also need to register a Jupyter kernelspec after installation. For Bash, run this in the same Python environment that Calepin uses:

```
python -m bash_kernel.install --sys-prefix
```

If you use `uv` run, the equivalent command is:

```
uv run python -m bash_kernel.install --sys-prefix
```

Some kernels are installed from their language's own package manager:

```
# Julia
julia -e 'using Pkg; Pkg.add("IJulia")'
```

Run `jupyter kernelspec list` to see what engines are registered and available.
