

Supported Languages

Calepin has built-in engines for **Python** and **R**. Diagram engines (**Mermaid**, **Graphviz DOT**, **TikZ**, **D2**) are also built in.

Any language with a Jupyter kernel works as an engine: use the kernel name as the chunk language. Popular examples include **Bash** (bash), **Julia** (julia), **Octave** (octave), **Gnuplot** (gnuplot), and **Ruby** (ruby). Install Jupyter kernels per the Jupyter install section.

Run `jupyter kernelspec list` to see what is registered. Whatever name appears in that list can be used as an engine name directly in a chunk:

```
```bash
echo "hello from bash"
```
```
