

Code execution

Calepin runs the code in your document and renders the results in place. The simplest way to run code is a fenced block named after its language.

Code blocks

Write an ordinary Typst fenced block and name it after a language. *Calepin* runs the block and shows its output below the source:

```
```python
print(40 + 2)
```
```

```
print(40 + 2)
```

```
42
```

Each language runs in a persistent session, so a variable set in one block is available in later blocks:

```
```python
x = 41
```
```

```
```python
print(x + 1)
```
```

```
x = 41
```

```
print(x + 1)
```

```
42
```

Inline code

An inline expression drops a computed value into a sentence. Use `#calepin.inline(...)`, usually through a short alias:

```
#let py = calepin.inline.with("python")
```

```
The answer is #py[`print(40 + 2)`].
```

The answer is 42.

Supported languages

Calepin has built-in engines for **Python** and **R**, and built-in diagram engines for **Mermaid**, **Graphviz DOT**, **TikZ**, and **D2**.

Any language with a Jupyter kernel also works: use the kernel name as the block language. Popular examples include **Bash** (bash), **Julia** (julia), **Octave** (octave), **Gnuplot** (gnuplot), and **Ruby** (ruby). Install kernels as described in the Jupyter install section.

Run `jupyter kernelspec list` to see what is registered. Whatever name appears there can be used as a block language directly:

```
```bash
echo "hello from bash"
```
```

Options

Options can be set in three places: as document-wide defaults, as arguments to one chunk, or as `#|` header lines inside a block.

Document defaults

`#calepin.setup` sets defaults for every chunk in the document:

```
#calepin.setup(echo: true, eval: true, results: "verbatim")
```

Chunk arguments

`#calepin.chunk(...)` overrides options for a single chunk. Pass the body as a fenced block and *Calepin* infers the engine from the fence:

```
#calepin.chunk(echo: false, results: "typst")[
  ```python
 print("#strong[42 in Typst]")
  ```
]
```

42 in Typst

`#|` header lines

You can also place options at the top of a plain fenced block, one per line, each prefixed with `#|`:

```
```r
#| echo: false
#| fig-align: right
plot(mpg ~ hp, data = mtcars)
```
```

The `#|` form keeps options next to the code. Its downside is outside *Calepin*: compiling the `.typ` file directly with `typst` shows the `#|` lines as text inside the code block, while options passed to `#calepin.chunk(...)` do not.

Options reference

Global and chunk options

These options can be set in `#calepin.setup` as document-wide defaults and overridden per chunk.

| Option | Default | Meaning |
|-------------------|-------------------|--|
| <code>echo</code> | <code>true</code> | Show the chunk's source code in the rendered document. |
| <code>eval</code> | <code>true</code> | Execute the code. When <code>false</code> , nothing runs and no output is produced (the source can still be shown via <code>echo</code>). |

| | | |
|-------------------|----------|---|
| error | false | When true, capture an execution error and render it as output. When false, an error in the chunk aborts the build. |
| warning | true | Include warnings emitted by the engine in the output. When false, they are suppressed. |
| message | true | Include informational messages emitted by the engine (for example R's <code>message()</code> output). When false, they are suppressed. |
| results | "render" | How results are shown: <code>render</code> (pretty display of values, images, and tables), <code>verbatim</code> (raw output in a code block), <code>typst</code> (treat output text as Typst markup and render it), or <code>hide</code> (run the code but omit its output). |
| fig-device-format | "svg" | Format for figure files written by the engine: <code>svg</code> , <code>png</code> , <code>jpeg</code> (alias <code>jpg</code>), or <code>pdf</code> . Diagram engines always emit <code>svg</code> regardless of this setting. |
| fig-device-dpi | 150 | Resolution in dots per inch for raster formats (<code>png</code> , <code>jpeg</code>). Ignored for vector formats (<code>svg</code> , <code>pdf</code>). |
| fig-device-width | 6 | Width of the plotting device, in inches. |
| fig-device-height | "auto" | Height of the plotting device, in inches. <code>auto</code> derives it from the width and <code>fig-device-aspect</code> . |
| fig-device-aspect | 0.618 | Height-to-width ratio used when <code>fig-device-height</code> is <code>auto</code> : $\text{device height} = \text{fig-device-width} \times \text{fig-device-aspect}$. |
| fig-width | "70%" | Width of the figure as rendered in the document. Accepts a Typst length or ratio (for example <code>70%</code> or <code>12cm</code>) or <code>auto</code> . |
| fig-height | "auto" | Height of the figure as rendered in the document. Accepts a Typst length or <code>auto</code> . |
| fig-align | "center" | Horizontal alignment of the figure in the document: <code>left</code> , <code>center</code> , or <code>right</code> . |
| fig-responsive | true | HTML output only: allow the figure to shrink to fit narrow viewports (sets <code>max-width: 100%</code>). No effect on paged output. |

Chunk-only options

These options are understood only on individual chunks; they are not valid keys in `#calepin.setup`. The caption and layout options live here because they apply to one chunk's specific output.

| Option | Default | Meaning |
|--------------------|------------|---|
| engine | inferred | Force the engine for this chunk instead of inferring it from the fence or surrounding context. |
| body | from fence | Provide the raw code body directly instead of writing a fenced block. |
| label | auto | Assign a stable chunk identifier used for cross-references and result lookup. |
| fig-caption | none | Caption text for the figure. When set, the output is wrapped in a numbered figure that can be cross-referenced. |
| fig-cap-location | "auto" | Where the caption sits relative to the figure: top, bottom, or margin. auto uses Typst's default placement. |
| fig-alt-text | none | Accessibility (alt) text for generated images. Empty when unset. |
| fig-subcaptions | none | Per-panel captions for a multi-image chunk, given as an array of strings (one per image, in order). |
| fig-layout-columns | "auto" | Column layout for a multi-image chunk: an integer number of equal columns, an array of explicit track sizes, or auto to choose a count from the number of images. |
| fig-layout-rows | "auto" | Row layout for a multi-image chunk: an integer number of equal rows, an array of explicit track sizes, or auto. |

Quarto-style names

Chunk options have different names in *Calepin* and Quarto. Some Quarto aliases are accepted, but using them is not recommended, and *Calepin* emits a warning when it meets an unsupported name. The accepted aliases are:

- out-width maps to fig-width
- out-height maps to fig-height
- out-align maps to fig-align
- fig-alt maps to fig-alt-text
- fig-subcap maps to fig-subcaptions
- fig-format maps to fig-device-format
- fig-dpi maps to fig-device-dpi
- layout-ncol maps to fig-layout-columns
- layout-nrow maps to fig-layout-rows
