

Notebook Typst layouts

layouts/notebook.typ is the Typst-side layout used by notebook outputs such as PDF and SVG.

```
themes/my-theme/  
layouts/  
notebook.typ
```

Before Typst runs, Calepin renders this file with MiniJinja so the output is still valid Typst source. The file uses a .typ extension because it renders to Typst, even though it is a MiniJinja template.

Inside the layout, place notebook content with document.body:

```
#set page(  
  paper: "us-letter",  
  margin: (x: 1in, y: 0.85in),  
  numbering: "1",  
)  
  
#set text(font: "Libertinus Serif", size: 10.5pt)  
  
{{ document.body }}
```

Useful layouts/notebook.typ values:

- theme: local theme directory name
- target: notebook
- document.path: .typ input path relative to workspace
- document.dir: input directory relative to workspace
- document.stem: input filename without .typ
- document.body: notebook body, injected as a #include
- document.meta: values from #metadata(...) <website-metadata>
- params: CLI parameter map

If document.body is not referenced, Calepin appends the notebook body after the rendered layout.

theme = "typst" disables notebook-specific theming, and extends = "typst" creates a local theme with no inherited Calepin base. Use an empty layouts/notebook.typ for a minimal pass-through layout. notebook.typ.jinja and paged.typ.jinja are not supported.
