

Themes

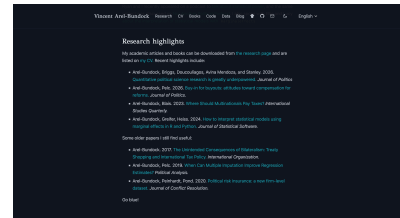

Themes control how *Calepin* renders two types of content: websites and notebooks (HTML or PDF). A website theme can provide MiniJinja HTML templates, partials, CSS, JavaScript, and notebook themes add typst-side template support for HTML and PDF outputs. The default theme is called *calepin*.

Choosing a theme

Select a different built-in or local theme with `theme` in a website's `calepin.toml`:

```
theme = "calepin"           # the default documentation theme
theme = "academic"         # a built-in essay/blog theme
theme = "themes/my-theme"   # a local theme directory
theme = "typst"             # raw Typst output, no Calepin theme
```

If the `calepin.toml` file is not located in the same directory as the document or website being compiled, you can specify the path to the config file with `--config`:

```
calepin compile notebook.typ --config=/path/to/calepin.toml
```

You can also set the theme in-document with:

```
#calepin.setup(theme: "academic")
```

When several theme settings are present during a compile, the document setting wins, then `calepin.toml`, then the default theme.

Structure

A theme can provide templates for website pages, single-document HTML, and Typst-level notebook rendering:

```
themes/my-theme/
theme.toml      # theme metadata
layouts/
  webpage.html  # layout for website pages
  notebook.html # layout for a single notebook rendered to HTML
  landing.html  # optional page-specific website layout
partials/      # MiniJinja fragments
styles/        # CSS files
scripts/       # JavaScript files
notebook.typ.jinja # Typst notebook template for PDF (and SVG)
```

The files in `layouts/` and `partials/` use the MiniJinja template language.
